

# TJA1049

## High-speed CAN transceiver with Standby mode

Rev. 4 — 15 January 2015

Product data sheet

## 1. General description

---

The TJA1049 high-speed CAN transceiver provides an interface between a Controller Area Network (CAN) protocol controller and the physical two-wire CAN bus. The transceiver is designed for high-speed CAN applications in the automotive industry, supplying the differential transmit and receive capability to (a microcontroller with) a CAN protocol controller.

The TJA1049 belongs to the third generation of high-speed CAN transceivers from NXP Semiconductors, offering significant improvements over first- and second-generation devices such as the TJA1040. It offers improved ElectroMagnetic Compatibility (EMC) and ElectroStatic Discharge (ESD) performance, and also features:

- Ideal passive behavior to the CAN bus when the supply voltage is off
- A very low-current Standby mode with bus wake-up capability
- TJA1049T/3 and TJA1049TK/3 can be interfaced directly to microcontrollers with supply voltages from 3 V to 5 V

The TJA1049 implements the CAN physical layer as defined in the current ISO11898 standard (ISO11898-2:2003, ISO11898-5:2007). Pending the release of the updated version of ISO11898-2 including CAN FD, additional timing parameters defining loop delay symmetry are specified. This implementation enables reliable communication in the CAN FD fast phase at data rates up to 2 Mbit/s.

These features make the TJA1049 an excellent choice for all types of HS-CAN networks, in nodes that require a low-power mode with wake-up capability via the CAN bus.

## 2. Features and benefits

---

### 2.1 General

- Fully ISO 11898-2:2003 and ISO 11898-5:2007 compliant
- Loop delay symmetry timing enables reliable communication at data rates up to 2 Mbit/s in the CAN FD fast phase
- Suitable for 12 V and 24 V systems
- Low ElectroMagnetic Emission (EME) and high ElectroMagnetic Immunity (EMI)
- $V_{IO}$  input on TJA1049T/3 and TJA1049TK/3 allows for direct interfacing with 3 V to 5 V microcontrollers
- SPLIT voltage output on TJA1049T and TJA1049TK for stabilizing recessive bus level
- Both variants available in SO8 and HVSON8 packages
- Leadless HVSON8 package (3.0 mm × 3.0 mm) with improved Automated Optical Inspection (AOI) capability

- AEC-Q100 qualified
- Dark green product (halogen free and Restriction of Hazardous Substances (RoHS) compliant)

## 2.2 Low-power management

- Very low-current Standby mode with host and bus wake-up capability
- Functional behavior predictable under all supply conditions
- Transceiver disengages from the bus when not powered up (zero load)

## 2.3 Protection

- High ESD handling capability on the bus pins
- Bus pins protected against transients in automotive environments
- Transmit Data (TXD) dominant time-out function
- Bus-dominant time-out function in Standby mode
- Undervoltage detection on pins  $V_{CC}$  and  $V_{IO}$
- Thermally protected

## 3. Quick reference data

Table 1. Quick reference data

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$V_{CC}$	supply voltage		4.75	-	5.25	V
$V_{IO}$	supply voltage on pin $V_{IO}$		2.8	-	5.5	V
$V_{uvd(VCC)}$	undervoltage detection voltage on pin $V_{CC}$		3.5	-	4.75	V
$V_{uvd(VIO)}$	undervoltage detection voltage on pin $V_{IO}$		1.3	2.0	2.7	V
$I_{CC}$	supply current	Standby mode: TJA1049T, TJA1049TK	-	10	15	$\mu$ A
		Standby mode: TJA1049T/3, TJA1049TK/3	-	-	5	$\mu$ A
		Normal mode; bus recessive	2.5	5	7.5	mA
		Normal mode; bus dominant	20	45	65	mA
$I_{IO}$	supply current on pin $V_{IO}$	Standby mode	5	-	14	$\mu$ A
		Normal mode; bus recessive	15	80	200	$\mu$ A
		Normal mode; bus dominant	-	350	1000	$\mu$ A
$V_{uvd(VIO)}$	undervoltage detection voltage on pin $V_{IO}$		1.3	2.0	2.7	V
$V_{ESD}$	electrostatic discharge voltage	IEC 61000-4-2 at pins CANH and CANL	-8	-	+8	kV
$V_{CANH}$	voltage on pin CANH		-58	-	+58	V
$V_{CANL}$	voltage on pin CANL		-58	-	+58	V
$V_{SPLIT}$	voltage on pin SPLIT		-58	-	+58	V
$T_{vj}$	virtual junction temperature		-40	-	+150	$^{\circ}$ C

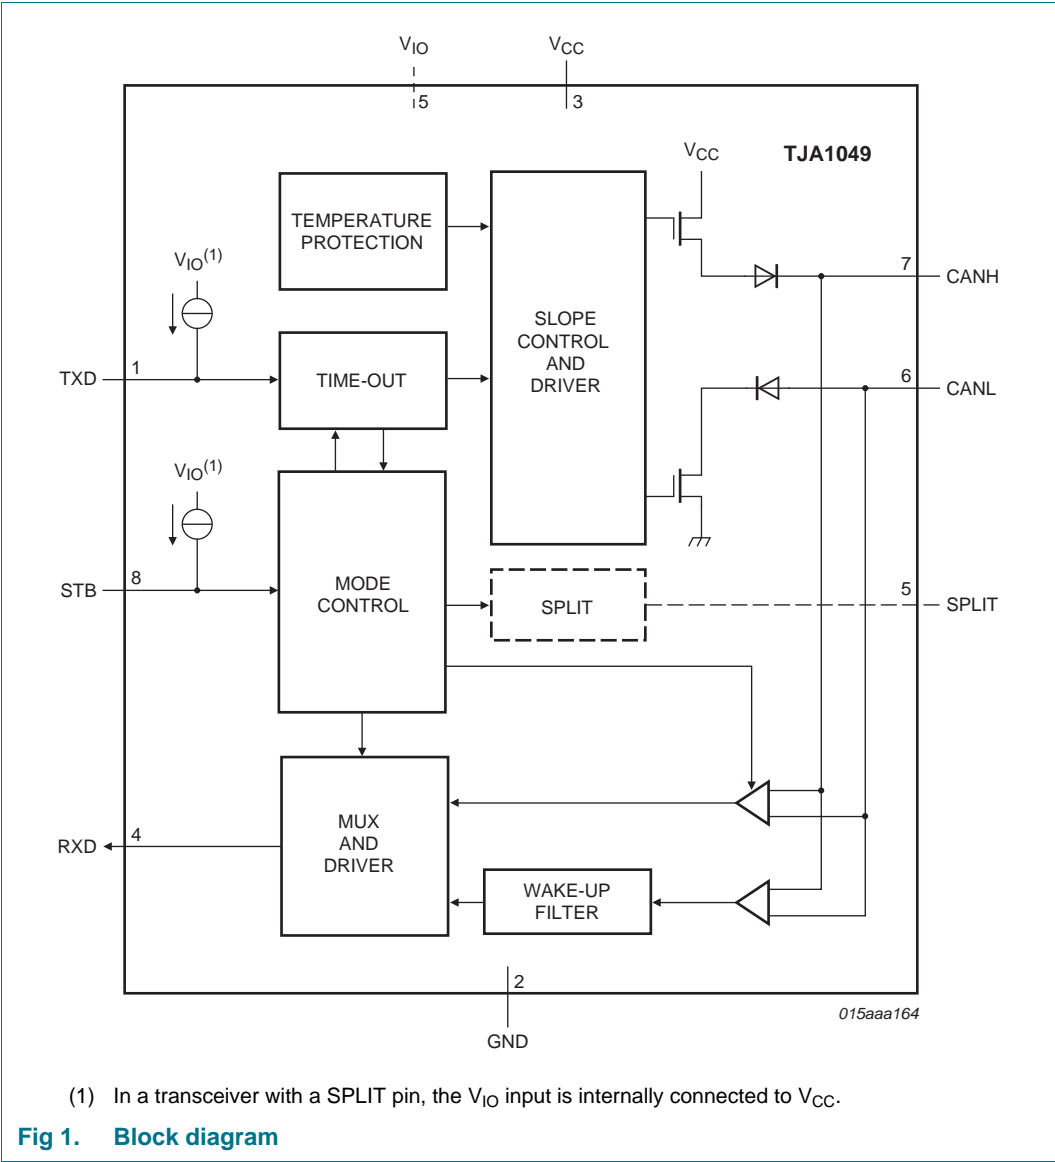

## 4. Ordering information

Table 2. Ordering information

Type number <sup>[1]</sup>	Package		
	Name	Description	Version
TJA1049T	SO8	plastic small outline package; 8 leads; body width 3.9 mm	SOT96-1
TJA1049TK	HVSON8	plastic thermal enhanced very thin small outline package; no leads; 8 terminals; body 3 × 3 × 0.85 mm	SOT782-1
TJA1049T/3	SO8	plastic small outline package; 8 leads; body width 3.9 mm	SOT96-1
TJA1049TK/3	HVSON8	plastic thermal enhanced very thin small outline package; no leads; 8 terminals; body 3 × 3 × 0.85 mm	SOT782-1

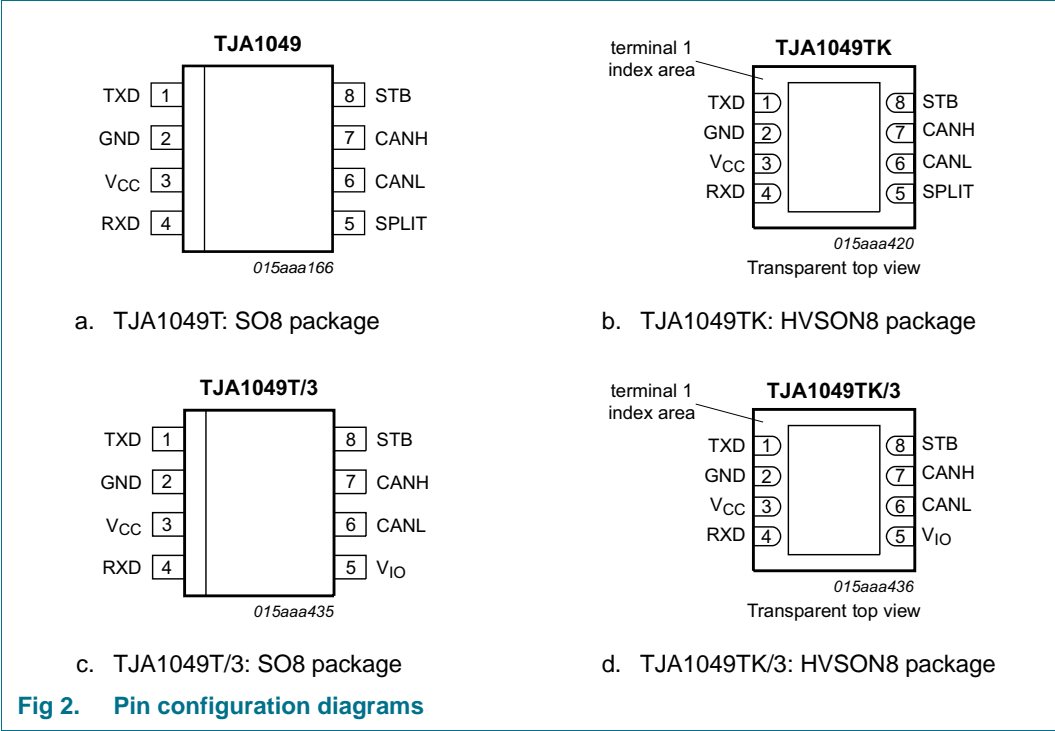

[1] TJA1049T and TJA1049TK with SPLIT pin; TJA1049T/3 and TJA1049TK/3 with V<sub>IO</sub> pin.

5. Block diagram

6. Pinning information

6.1 Pinning

6.2 Pin description

Table 3. Pin description

Symbol	Pin	Description
TXD	1	transmit data input
GND	2 <sup>[1]</sup>	ground supply
V <sub>CC</sub>	3	supply voltage
RXD	4	receive data output; reads out data from the bus lines
SPLIT	5	common-mode stabilization output; TJA1049T and TJA1049TK only
V <sub>IO</sub>	5	supply voltage for I/O level adapter; TJA1049T/3 and TJA1049TK/3 only
CANL	6	LOW-level CAN bus line
CANH	7	HIGH-level CAN bus line
STB	8	Standby mode control input

[1] For enhanced thermal and electrical performance, the exposed center pad of the HVSON8 package should be soldered to board ground.

## 7. Functional description

The TJA1049 is a HS-CAN stand-alone transceiver with Standby mode. It combines the functionality of the PCA82C250, PCA82C251 and TJA1040 transceivers with improved EMC and ESD handling capability and quiescent current performance. Improved slope control and high DC handling capability on the bus pins provide additional application flexibility.

The TJA1049 is available in two versions, distinguished only by the function of pin 5:

- The TJA1049T and TJA1049TK are 100 % backwards compatible with the TJA1040 when operating with a 5 V microcontroller, and also cover existing PCA82C250 and PCA82C251 applications
- The TJA1049T/3 and TJA1049TK/3 allow for direct interfacing to microcontrollers with supply voltages down to 3 V

### 7.1 Operating modes

The TJA1049 supports two operating modes, Normal and Standby, which are selectable via pin STB. See [Table 4](#) for a description of the operating modes under normal supply conditions.

**Table 4. Operating modes**

Mode	Pin STB	Pin RXD	
		LOW	HIGH
Normal	LOW	bus dominant	bus recessive
Standby	HIGH	wake-up request detected	no wake-up request detected

#### 7.1.1 Normal mode

A LOW level on pin STB selects Normal mode. In this mode, the transceiver can transmit and receive data via the bus lines CANH and CANL (see [Figure 1](#) for the block diagram). The differential receiver converts the analog data on the bus lines into digital data which is output on pin RXD. The slopes of the output signals on the bus lines are controlled internally and are optimized in a way that guarantees the lowest possible EME.

#### 7.1.2 Standby mode

A HIGH level on pin STB selects Standby mode. In Standby mode, the transceiver is not able to transmit or correctly receive data via the bus lines. The transmitter and Normal-mode receiver blocks are switched off to reduce supply current, and only a low-power differential receiver monitors the bus lines for activity. The wake-up filter on the output of the low-power receiver does not latch bus dominant states, but ensures that only bus dominant and bus recessive states that persist longer than  $t_{\text{fltr(wake)}}_{\text{bus}}$  are reflected on pin RXD.

In Standby mode, the bus lines are biased to ground to minimize the system supply current. The low-power receiver is supplied by  $V_{\text{IO}}$ , and is capable of detecting CAN bus activity even if  $V_{\text{IO}}$  is the only supply voltage available. When pin RXD goes LOW to signal a wake-up request, a transition to Normal mode will not be triggered until STB is forced LOW.

## 7.2 Fail-safe features

### 7.2.1 TXD dominant time-out function

A 'TXD dominant time-out' timer is started when pin TXD is set LOW. If the LOW state on pin TXD persists for longer than  $t_{to(dom)TXD}$ , the transmitter is disabled, releasing the bus lines to recessive state. This function prevents a hardware and/or software application failure from driving the bus lines to a permanent dominant state (blocking all network communications). The TXD dominant time-out timer is reset when pin TXD is set HIGH. The TXD dominant time-out time also defines the minimum possible bit rate of 40 kbit/s.

### 7.2.2 Bus dominant time-out function

In Standby mode, a 'bus dominant time-out' timer is started when the CAN bus changes from recessive to dominant state. If the dominant state on the bus persists for longer than  $t_{to(dom)bus}$ , the RXD pin is forced HIGH. This prevents a clamped dominant bus (due to a bus short-circuit or a failure in one of the other nodes on the network) generating a permanent wake-up request. The bus dominant time-out timer is reset when the CAN bus changes from dominant to recessive state.

### 7.2.3 Internal biasing of TXD and STB input pins

Pins TXD and STB have internal pull-ups to  $V_{IO}$  to ensure a safe, defined state in case one (or both) of these pins is left floating. Pull-up currents flow in these pins in all states; both pins should be held HIGH in Standby mode to minimize standby current.

### 7.2.4 Undervoltage detection on pins $V_{CC}$ and $V_{IO}$

Should  $V_{CC}$  drop below the  $V_{CC}$  undervoltage detection level,  $V_{uvd}(V_{CC})$ , the transceiver will switch to Standby mode. The logic state of pin STB will be ignored until  $V_{CC}$  has recovered.

Should  $V_{IO}$  drop below the  $V_{IO}$  undervoltage detection level,  $V_{uvd}(V_{IO})$ , the transceiver will switch off and disengage from the bus (zero load) until  $V_{IO}$  has recovered.

### 7.2.5 Overtemperature protection

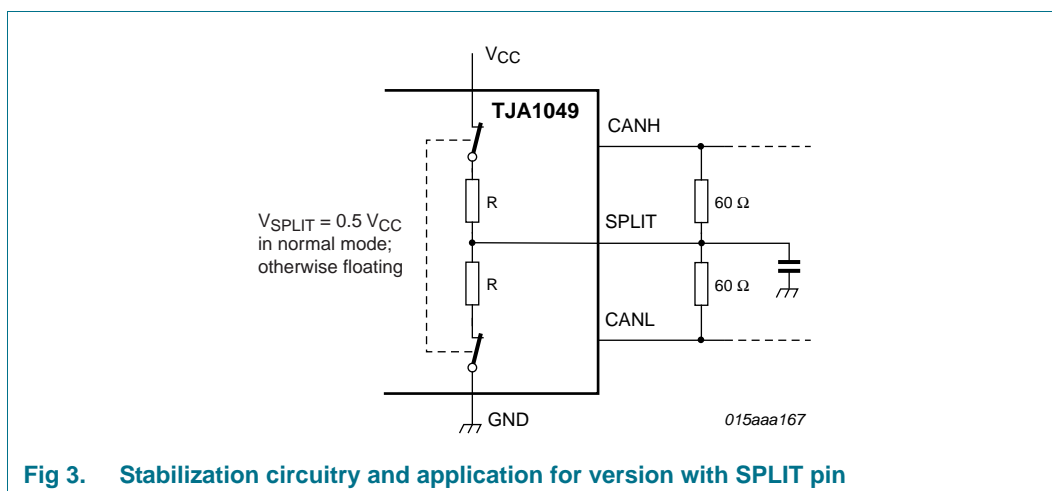

The output drivers are protected against overtemperature conditions. If the virtual junction temperature exceeds the shutdown junction temperature,  $T_{j(sd)}$ , the output drivers will be disabled until the virtual junction temperature falls below  $T_{j(sd)}$  and TXD becomes recessive again. Including the TXD condition ensures that output driver oscillation due to temperature drift is avoided.

## 7.3 SPLIT output pin and $V_{IO}$ supply pin

Two versions of the TJA1049 are available, only differing in the function of a single pin. Pin 5 is either a SPLIT output pin or a  $V_{IO}$  supply pin.

### 7.3.1 SPLIT pin

Using the SPLIT pin on the TJA1049T or TJA1049TK in conjunction with a split termination network (see [Figure 3](#) and [Figure 6](#)) can help to stabilize the recessive voltage level on the bus. This will reduce EME in networks with DC leakage to ground (e.g. from deactivated nodes with poor bus leakage performance). In Normal mode, pin SPLIT delivers a DC output voltage of  $0.5V_{CC}$ . In Standby mode or when  $V_{CC}$  is off, pin SPLIT is floating.

### 7.3.2 $V_{IO}$ supply pin

Pin  $V_{IO}$  on the TJA1049T/3 and TJA1049TK/3 should be connected to the microcontroller supply voltage (see [Figure 7](#)). This will adjust the signal levels of pins TXD, RXD and STB to the I/O levels of the microcontroller. Pin  $V_{IO}$  also provides the internal supply voltage for the low-power differential receiver of the transceiver. For applications running in low-power mode, this allows the bus lines to be monitored for activity even if there is no supply voltage on pin  $V_{CC}$ .

For versions of the TJA1049 without a  $V_{IO}$  pin, the  $V_{IO}$  input is internally connected to  $V_{CC}$ . This sets the signal levels of pins TXD, RXD and STB to levels compatible with 5 V microcontrollers.

## 8. Limiting values

**Table 5. Limiting values**

In accordance with the Absolute Maximum Rating System (IEC 60134). All voltages are referenced to GND.

Symbol	Parameter	Conditions	Min	Max	Unit
$V_x$	voltage on pin x	on pins CANH, CANL and SPLIT	-58	+58	V
		on any other pin	-0.3	+7	V
$V_{trt}$	transient voltage	on pins CANH and CANL [1]	-150	+100	V
$V_{ESD}$	electrostatic discharge voltage	IEC 61000-4-2 (150 pF, 330 $\Omega$ ) [2]			
		at pins CANH and CANL	-8	+8	kV
		Human Body Model (HBM); 100 pF, 1.5 k $\Omega$ [3]			
		at pins CANH and CANL	-8	+8	kV
		at any other pin	-4	+4	kV
		Machine Model (MM); 200 pF, 0.75 $\mu$ H, 10 $\Omega$ [4]			
		at any pin	-300	+300	V
		Charged Device Model (CDM); field Induced charge; 4 pF [5]			
		at corner pins	-750	+750	V
		at any pin	-500	+500	V
$T_{vj}$	virtual junction temperature	[6]	-40	+150	°C
$T_{stg}$	storage temperature		-55	+150	°C

[1] Verified by an external test house to ensure pins CANH and CANL can withstand ISO 7637 part 3 automotive transient test pulses 1, 2a, 3a and 3b.

[2] According to IEC TS 62228 (2007), Section 4.3; DIN EN 61000-4-2.

[3] According to AEC-Q100-002.

[4] According to AEC-Q100-003.

[5] According to AEC-Q100-011 Rev-C1. The classification level is C4B.

[6] In accordance with IEC 60747-1. An alternative definition of virtual junction temperature is:  $T_{vj} = T_{amb} + P \times R_{th(vj-a)}$ , where  $R_{th(vj-a)}$  is a fixed value to be used for the calculation of  $T_{vj}$ . The rating for  $T_{vj}$  limits the allowable combinations of power dissipation (P) and ambient temperature ( $T_{amb}$ ).

## 9. Thermal characteristics

**Table 6. Thermal characteristics**

According to IEC 60747-1.

Symbol	Parameter	Conditions	Typ	Unit
$R_{th(j-a)}$	thermal resistance from junction to ambient	SO8 package; in free air	145	K/W
		HVSON8 package; in free air	50	K/W

## 10. Static characteristics

**Table 7. Static characteristics**

$T_{vj} = -40\text{ }^{\circ}\text{C}$  to  $+150\text{ }^{\circ}\text{C}$ ;  $V_{CC} = 4.75\text{ V}$  to  $5.25\text{ V}$ ;  $V_{IO} = 2.8\text{ V}$  to  $5.5\text{ V}$  <sup>[1]</sup>;  $R_L = 60\text{ }\Omega$  unless specified otherwise; All voltages are defined with respect to ground. Positive currents flow into the IC. <sup>[2]</sup>

<b>Temperature detection</b>						
$T_{j(sd)}$	shutdown junction temperature	[4]	-	190	-	$^{\circ}\text{C}$

[1] Only TJA1049T/3 and TJA1049TK/3 have a  $V_{IO}$  pin; in TJA1049T and TJA1049TK, the  $V_{IO}$  input is internally connected to  $V_{CC}$ .

[2] All parameters are guaranteed over the virtual junction temperature range by design. Factory testing uses correlated test conditions to cover the specified temperature and power supply voltage range.

- [3] Maximum value assumes  $V_{CC} < V_{IO}$ ; if  $V_{CC} > V_{IO}$ , the maximum value will be  $V_{CC} + 0.3$  V.
- [4] Not tested in production; guaranteed by design.
- [5]  $V_{cm(CAN)}$  is the common mode voltage of CANH and CANL.
- [6] For TJA1049T/3 and TJA1049TK/3: values valid when  $V_{IO} = 4.5$  V to 5.5 V; when  $V_{IO} = 2.8$  V to 4.5 V, values valid when  $V_{cm(CAN)} = -12$  V to +12 V.

## 11. Dynamic characteristics

**Table 8. Dynamic characteristics**

$T_{vj} = -40$  °C to +150 °C;  $V_{CC} = 4.75$  V to 5.25 V;  $V_{IO} = 2.8$  V to 5.5 V<sup>[1]</sup>;  $R_L = 60$   $\Omega$  unless specified otherwise. All voltages are defined with respect to ground. Positive currents flow into the IC.<sup>[2]</sup>

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
<b>Transceiver timing; pins CANH, CANL, TXD and RXD; see Figure 8 and Figure 4</b>						
$t_{d(TXD-busdom)}$	delay time from TXD to bus dominant	Normal mode	-	65	-	ns
$t_{d(TXD-busrec)}$	delay time from TXD to bus recessive	Normal mode	-	90	-	ns
$t_{d(busdom-RXD)}$	delay time from bus dominant to RXD	Normal mode	-	60	-	ns
$t_{d(busrec-RXD)}$	delay time from bus recessive to RXD	Normal mode	-	65	-	ns
$t_{PD(TXD-RXD)}$	propagation delay from TXD to RXD	versions with SPLIT pin Normal mode	60	-	220	ns
		versions with $V_{IO}$ pin Normal mode	60	-	250	ns
$t_{bit(RXD)}$	bit time on pin RXD	$t_{bit(TXD)} = 500$ ns <sup>[3]</sup>	400	-	550	ns
$t_{to(dom)TXD}$	TXD dominant time-out time	$V_{TXD} = 0$ V; Normal mode	0.3	2	5	ms
$t_{to(dom)bus}$	bus dominant time-out time	Standby mode	0.3	2	5	ms
$t_{fltr(wake)bus}$	bus wake-up filter time	version with SPLIT pin Standby mode	0.5	1	3	$\mu$ s
		versions with $V_{IO}$ pin Standby mode	0.5	1.5	5	$\mu$ s
$t_{d(stb-norm)}$	standby to normal mode delay time		7	25	47	$\mu$ s

- [1] Only TJA1049T/3 and TJA1049TK/3 have a  $V_{IO}$  pin; in the TJA1049T and TJA1049TK, the  $V_{IO}$  input is internally connected to  $V_{CC}$ .
- [2] All parameters are guaranteed over the virtual junction temperature range by design. Factory testing uses correlated test conditions to cover the specified temperature and power supply voltage range.
- [3] See Figure 5.

## 12. Application information

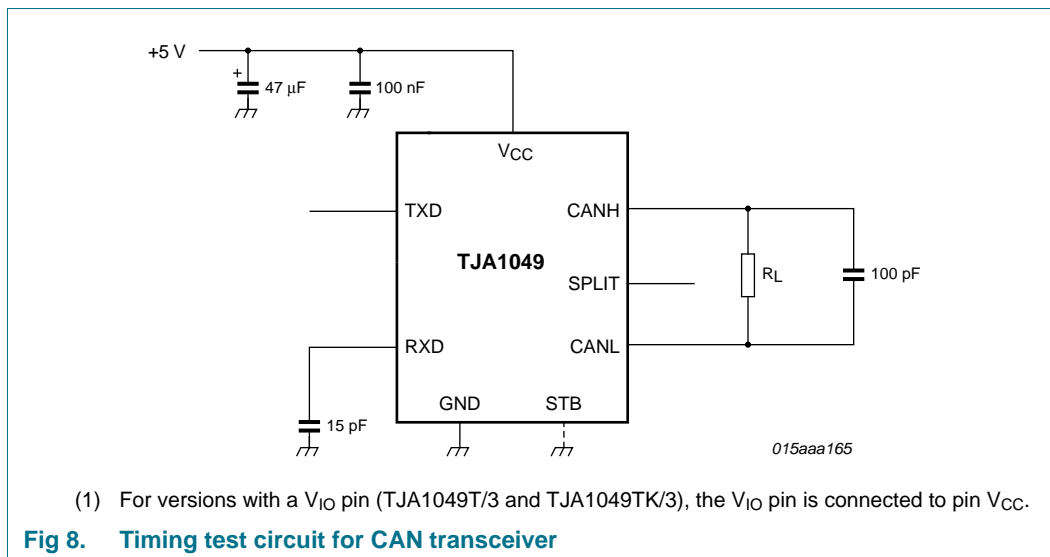

## 12.1 Application diagrams

## 12.2 Application hints

Further information on the application of the TJA1049 can be found in NXP application hints *AH1021 Application Hints - High-speed CAN transceiver TJA1049*.

## 13. Test information

### 13.1 Quality information

This product has been qualified in accordance with the Automotive Electronics Council (AEC) standard Q100 Rev-G - *Failure mechanism based stress test qualification for integrated circuits*, and is suitable for use in automotive applications.

14. Package outline

SO8: plastic small outline package; 8 leads; body width 3.9 mm

## 15. Handling information

All input and output pins are protected against ElectroStatic Discharge (ESD) under normal handling. When handling ensure that the appropriate precautions are taken as described in *JESD625-A* or equivalent standards.

## 16. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365 "Surface mount reflow soldering description"*.

### 16.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

### 16.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- Board specifications, including the board finish, solder masks and vias
- Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

### 16.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

## 16.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see [Figure 11](#)) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with [Table 9](#) and [10](#)

**Table 9. SnPb eutectic process (from J-STD-020D)**

Package thickness (mm)	Package reflow temperature (°C)	
	Volume (mm <sup>3</sup> )	
	< 350	≥ 350
< 2.5	235	220
≥ 2.5	220	220

**Table 10. Lead-free process (from J-STD-020D)**

Package thickness (mm)	Package reflow temperature (°C)		
	Volume (mm <sup>3</sup> )		
	< 350	350 to 2000	> 2000
< 1.6	260	260	260
1.6 to 2.5	260	250	245
> 2.5	250	245	245

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see [Figure 11](#).

For further information on temperature profiles, refer to Application Note *AN10365* “Surface mount reflow soldering description”.

## 17. Soldering of HVSON packages

[Section 16](#) contains a brief introduction to the techniques most commonly used to solder Surface Mounted Devices (SMD). A more detailed discussion on soldering HVSON leadless package ICs can be found in the following application notes:

- *AN10365 “Surface mount reflow soldering description”*
- *AN10366 “HVQFN application information”*

## 19. Legal information

### 19.1 Data sheet status

Document status <sup>[1][2]</sup>	Product status <sup>[3]</sup>	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

[1] Please consult the most recently issued document before initiating or completing a design.

[2] The term 'short data sheet' is explained in section "Definitions".

[3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL <http://www.nxp.com>.

### 19.2 Definitions

**Draft** — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

**Short data sheet** — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

**Product specification** — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

### 19.3 Disclaimers

**Limited warranty and liability** — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

**Right to make changes** — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

**Suitability for use in automotive applications** — This NXP Semiconductors product has been qualified for use in automotive applications. Unless otherwise agreed in writing, the product is not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

**Applications** — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

**Limiting values** — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

**Terms and conditions of commercial sale** — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at <http://www.nxp.com/profile/terms>, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

**No offer to sell or license** — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

**Export control** — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

**Quick reference data** — The Quick reference data is an extract of the product data given in the Limiting values and Characteristics sections of this document, and as such is not complete, exhaustive or legally binding.

**Translations** — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.
